Terraform Public Registry: Case Handling in CSP

This article details the interim process for CSP to handle Terraform Public Registry tickets without R&D access to CSP (IBM Support Portal)

It includes instructions for engaging Registry Engineering and managing communication throughout the support ticket lifecycle.

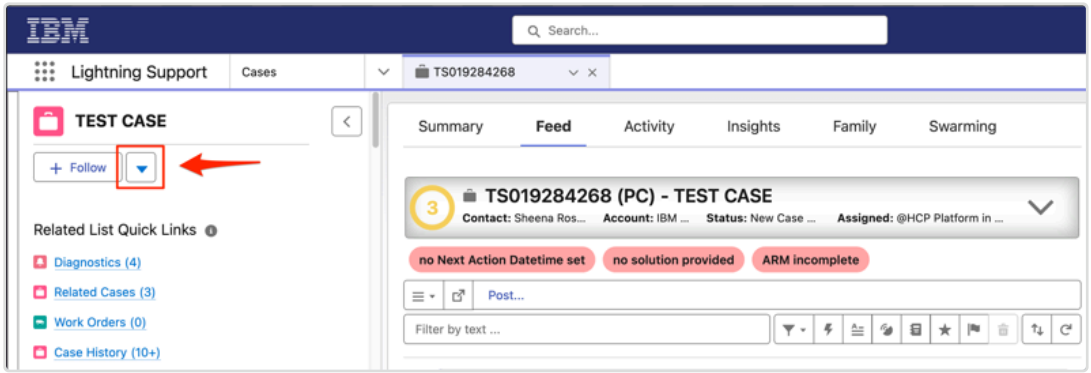

> **This is an interim process designed for the Support team to serve as a mediator**.
>
> Phase II (Discussion starting in April): The Registry team will work on PLC Support enablement plan for Self and Cloud Managed both to handle some of these requests and inquiries independently in the future. More information is coming, so please stay tuned!

Important Notes

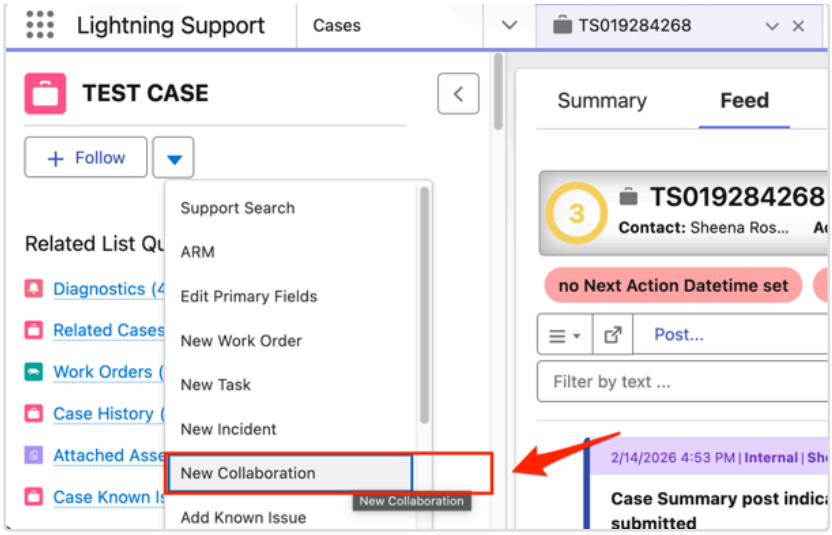

- This process is applicable for both HCP TF and Self-Managed customers, while entitlements are OFF in CSP for Hashicorp products, that we are helping a **paying/enterprise customer only**
- Engagement method: JIRA for Sev 2/3/4 and PagerDuty for Sev1. Support acts as the intermediary between the customer and Registry Engineering throughout the case lifecycle.
- SLA Breach: Since Engineering doesn't receive breach alerts yet, please keep Jira updated and request for timely responses. If you anticipate a delay or a potential SLA breach, escalate it to your direct manager immediately.
- Non-Paying (Free Tier/Partner/Community Edition) customers - we need to route customers to use the existing Registry support email address: terraform-registry@hashicorp.com

Instructions

1. Send a first response to the customer CSP, informing them we will engage our Registry team .
2. Follow the steps to Open a Collaboration Case:
   a. In your case view, go to the left panel and click “down arrow” to expand.

   b. Select “New Collaboration” to create a Collaboration Case.

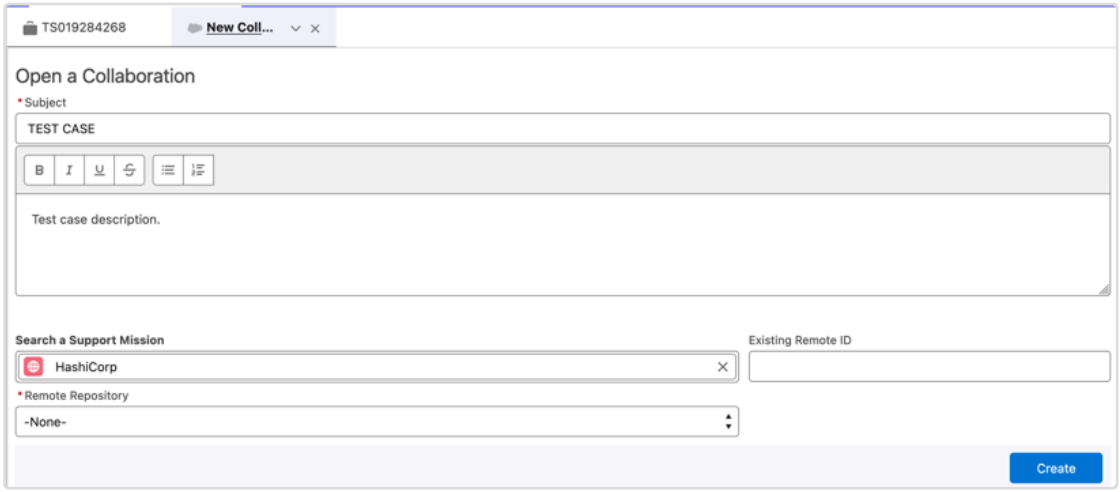

c. This opens a tab with the following fields:

i. Subject - populates Jira title

ii. Description - include the full information provided by the customer

iii. Search a Support Mission: defaults to HashiCorp

iv. Remote Repository - select **Terraform - JIRA - Terraform Public Registry**

3. Monitor both the CSP ticket and the Jira request.
4. Manually follow up with the customer as needed to avoid SLA breach.
5. Add any relevant customer updates, findings, or new information to the Jira ticket.
6. Communicate Registry Engineering updates back to the customer in CSP.
